## Numerical Problems

Please complete the following numerical problems by hand (or in a Rmd document like this one).

### Problem 1

Let  $S = \$100$ ,  $K = \$105$ ,  $r = 8\%$ ,  $T = 0.5$ , and  $\delta = 0.0$ . Let  $u = 1.3$ ,  $d = 0.8$ , and  $n = 1$ .

- a. What are the premium,  $\Delta$ , and  $B$  for a European call?
- b. What are the premium,  $\Delta$ , and  $B$  for a European put?

### Problem 2

Let  $S = \$100$ ,  $K = \$95$ ,  $r = 8\%$ ,  $T = 0.5$ , and  $\delta = 0.0$ . Let  $u = 1.3$ ,  $d = 0.8$ , and  $n = 1$ .

- a. Verify that the price of a European put is \$7.471.
- b. Suppose you observe a call price of \$17. What is the arbitrage?
- c. Suppose you observe a call price of \$15.50. What is the arbitrage?

### Problem 3

Let  $S = \$100$ ,  $K = \$95$ ,  $\sigma = 30\%$ ,  $r = 8\%$ ,  $T = 1$ , and  $\delta = 0.0$ . Let  $u = 1.3$ ,  $d = 0.8$ , and  $n = 2$ . Construct the binomial tree for a call option. At each node provide the premium,  $\Delta$ , and  $B$ .

### Problem 4

Repeat the option price calculation in the previous question for stock prices of \$80, \$90, \$110, \$120, and \$130, but now let  $n = 3$ . Keep everything else fixed. What happens to the initial option  $\Delta$  as the stock price increases?

### Problem 5

Let  $S = \$100$ ,  $K = \$95$ ,  $r = 8\%$  (continuously compounded),  $\sigma = 30\%$ ,  $\delta = 0$ , and  $T = 1$  year and  $n = 3$ .

- a. What is the premium for an American call option? Is there any early exercise?
- b. What is the premium for a European call option? Use the computational shortcut with the risk-neutral binomial pmf that I showed you in class. Compare the American and European premia.
- c. What is the premium for a European put? Does put-call parity hold? (see McDonald Chapter 9). Also use the risk-neutral binomial pmf for this problem.
- d. What is the premium of the American put? Compare with the European put. If they differ, explain why.

**Problem 6**

Let  $S = \$40$ ,  $K = \$40$ ,  $r = 8\%$  (continuously compounded),  $\sigma = 30\%$ ,  $\delta = 0.0$ ,  $T = 0.5$  year, and  $n = 3$ .

- a. Construct the binomial tree for the stock. What are  $u$  and  $d$ ?
- b. Compute the premia of American and European calls and puts.
